

Professional statement

My career transition from Learning Sciences and HR Learning & Development into cybersecurity is rooted in a fundamental desire to help people and protect organizational assets. Throughout my career, I have prided myself on my diligent work ethic, strategic planning capabilities, and ability to quickly master new concepts. These traits naturally align with the fast-paced, ever-evolving landscape of the tech industry.

I am highly principled and value maintaining strong security standards, which drives my interest in building secure, compliant digital environments. I find deep satisfaction in analytical problem-solving. Whether it is actively hunting for anomalies, investigating unusual network logs, or troubleshooting complex security issues. I believe that security is about ensuring systems function safely and exactly as designed, without unauthorized disruption.

By blending the strong communication and analytical soft skills developed in HR with my new technical competencies, I offer a unique, well-rounded perspective to security operations. I am a resilient, continuous learner who never gives up on a problem, and I am fully committed to applying this dedication to help forward-thinking companies uphold their values, mitigate risks, and reach their security objectives.
